1

1 Background

The purpose of this document is to describe the method for White Space Database (WSDB) Operators in the United States TV band to interchange records of protected entities and fixed TVBD that are registered by one WSDB operator, but must be supplied to all other WSDB Operators per Federal Communications Commission (FCC) rules.

1.1 Possible Methods to interchange records that were considered by the White Space DBA Group

Three methods were considered for exchanging records

- Real time
- File Transfer
- Database Replication

1.1.1 Real Time

Records may be exchanged between providers in real time as updates to the registrations occur. Real time is typically implemented as some form of web service. Two mechanisms may be used:

“Pull” where the server (the provider with the record) waits until the client (the provider who wants the record) to query it for updates. The client queries, and the server responds with all changes that have occurred since the last query. Options may exist to obtain all records for start up or failure recovery purposes.

“Push” where the server sends records as they are generated to each client. This may use a subscribe/publish mechanism, or an equivalent web service.

Both push and pull mechanisms are often deployed.

1.1.2 File Transfer

A set of records is stored in a file, and the files are retrieved using a secure file transfer protocol. Both full set and incremental files can be created and retrieved.

1.1.3 Database Replication

Mechanisms exist for maintaining replicas of a database. A common set of table definitions is established, and a toolset is employed that automatically replicates the tables on other systems. Some proprietary mechanisms allow multiple masters. Others, including some open source versions, have a single master and multiple replicas, maintained automatically. For the former, all providers would share a single set of records, and any provider could add/delete or modify the records. For the latter, a table would be maintained on each provider’s system for each of the

Database Synchronization Interoperability Specification

other providers and changes in the master would be automatically replicated in each of the replicas.

1.2 Conclusions

Both file transfer and real time methods must be supported by all WSDB Administrators. The initial transport for both bulk loads and incremental updates will be via SFTP. Upon implementation of the Web Services it shall be used for Incremental Updates only. The SFTP implementation will be continued for doing Bulk Loads.

1.3 Glossary

Registration Ensemble	The root element of the XML document which constitutes the message exchanged by WSDB Providers. There is one per message (either file FTP or Real Time Poll) and wraps the Registration Objects
Registration Object	The object which represents an individual Registration event, of any of the five types: MVPD_Registrant, TV_Receive_Site_Registration, LP-Aux_Registration, Fixed_TVBD_Registration, Temp_BAS_Registration
Registration Disposition	The element which contains meta-information about a Registration Object, such as the time of Registration and the Registration ID
Reservation Object	An element of type Event (used in LP-Aux_Registration and Temp_BAS_Registration) used to indicate the start and end time of requested protection, either as a single event or a recurring event.

2 Data Layout

The registration information is encoded within an XML document containing a <RegistrationRecordEnsemble> element as its root element (see below). The Ensemble may contain a series of Registration objects from the five types based on the FCC Rules.

For example:

Database Synchronization Interoperability Specification

3 File Transfer method:

The files shall reside in datastores operated individually by the WSDB Administrators. Within each WSDB Administrator's area the files shall be of two kinds. There will be Full files containing all past registrations and Incremental files containing only the previous day's incremental registrations. Incremental files shall be updated hourly. Full data files shall be updated daily until web services are deployed, when files are generated on request of any WSDB Administrator. Each WSDB Administrator may retrieve files from any other WSDB at any time. All files shall be zip compressed.

The file naming conventions will encode information about the contents of the file. Files shall be named:

\$TVBandsAdminName.V\$Version.\$FileType. \$Timestamp.zip

Where

Database Synchronization Interoperability Specification

- TVBandsAdminName = " 4 characters, upper case: COMS, FFIN, GOOG, KBLS, KEYB, NUES, SPBR, TELC, AIRI
- Version = NN (File Specification Version Number; this spec is version “01”)
- FileType = "All" or "Incr"
- Timestamp = ISO 8601 date and time, Zulu time required, basic format. (“YYYYMMDDTHHmmssZ”)

Note that the letter ‘V’ appears explicitly in the version portion of the file name and the letters T and Z appear in the timestamp portion, for readability. An example name would thus be:

TELC.V01.All.20110213T2300Z.zip

which would be interpreted as a file containing all registration records received by Telcordia up to and including 11:00 PM GMT on February 13, 2011, and conforming to Version 01 of this Interoperability Specification.

A file contains one RegistrationRecordEnsemble, see Section 5.1. The RegistrationRecordEnsemble contains a NextTransactionID, that can be used by the real time web service to retrieve changes in the database since the file was created. This can be used to initialize a new server, or to recover from a failure with records from the WSDB Administrator that created the file.

4 Real Time Web Service

The real time web service is an interface that provides a set of Insert/Delete/Modify transactions in real time as the database at any Administrator changes. The service uses Simple Object Access Protocol (SOAP) to manage the transfer of data. Data is in Extensible Markup Language (XML) format. Transaction Layer Security (TLS) provides a private and secure means for transferring data.

The basic mechanism is a “fast poll”. Clients of the server poll the server relatively rapidly to ask for updates. Poll intervals between 1 and 1000 seconds are allowed, determined by the client. The server responds with all transactions in the database since the last completed poll. In the poll, the client provides a “TransactionID” in the request. A new TransactionId is returned in the response, which is used in the next poll. TransactionIds no older than 72 hours are permitted; any poll with a transactionId older than this will generate an error in the poll. Clients who remain off-line for more than 72 hours will need to start with the latest daily file, which contains the transactionId that can be used after loading the file to retrieve all updates since the file was created. Each client must use the transactionID it receives, either from a file download or a prior transactionId in a subsequent poll. TransactionIds are not (necessarily) the same between clients. TransactionID streams are maintained independently by each WSDB Administrator (server side), and each server may use a different syntax for the transactionID.

Database Synchronization Interoperability Specification

It is planned that all WSDB Administrators will provide two Services. One that is published for access to the “Production” TV Band White Space registrations and a second distinct Service that is published for accessing “Test” TV Band White Space registrations. The Test data is for the purpose of supporting and demonstrating interoperability amongst the WSDB Administrators when both parties are not in Production. All WSDB Administrators will provide the capability to access all Published Services.

The three tables below show the definitions of the elements that are involved in the Real Time Web Service. Note the sequence of events involving the TransactionID elements:

- 1) The client sends a RealTimePollRequest with a TID called RequestedTransactionID
- 2) The server responds with a RealTimePollResponse that has
 - a. RequestedTransactionID which has the same value as the one it received
 - b. NextTransactionID embedded in the RegistrationRecordEnsemble
- 3) The client uses the value of the NextTransactionID which it received as the RequestedTransactionID in its next RealTimePollRequest
- 4) In the event that more than 72 hours have elapsed since the last successful RealTimePollRequest and Response, then the client must receive the full file via FTP. In this case also, a NextTransactionID will be embedded in the RegistrationRecordEnsemble for use in the subsequent RealTimePollRequest.

The Poll Request :

Message Definition: RealTimePollRequest (wsd:RealTimePollRequest)

Lev.	Element Name	Element Type	Occ.	Description
1	<RealTimePollRequest>		1	Contains all of the Registration Records
2	Command	wsd:Command	1	wsdPoll is the only allowed value
2	RequestedTransactionId	wsd:TransactionId	1	TransactionID contained in the RegistrationRecordEnsemble in the last valid response to a poll
1	</RealTimePoll>			

The Poll Response is:

Message Definition: RealTimePollResponse (wsd:RealTimePollResponse)

Lev.	Element Name	Element Type	Occ.	Description
1	<RealTimePollResponse>		1	Contains all of the Registration Records
2	Command	wsd:Command	1	wsdPollResponse is the only allowed value
2	RegistrationRecordEnsemble	wsd:RegistrationRecordEnsemble	0-1	Records changed since last poll
2	RequestedTransactionId	wsd:TransactionId	1	TransactionID received in the RealTimePollRequest

Database Synchronization Interoperability Specification

Message Definition: RealTimePollResponse (wsd:RealTimePollResponse)

Lev.	Element Name	Element Type	Occ.	Description
2	RT-PollStatusCode	wsd: RT-PollResponseStatusCodeSeries	1	Status code returned by server. 0=Success, any other value indicates failure as enumerated in XSD
1	</RealTimePollResponse>			

The RT-PollStatusCode is an enumeration defined in the XSD as follows:

The WSDL is attached as Appendix C.

5 Data Format

The data is valid XML conforming to the schema located in Appendix B. It can be stated that the Schema IS the definition of the interface, because tools exist to determine the conformance of an arbitrary XML document to a specific Schema. Any data interchange message, whether transported by SFTP file transfer or by Web Services will only be accepted by a WSDBA if it conforms to the agreed-upon schema. If an arriving message does not conform, Error Handling procedures must be performed as described in Section 7.

This specification includes, by reference, these other XML Schema:

Schema	Purpose	Canonical prefix in WSDB objects	for more info see
			actual namespace URN
iCal	indication of	ical	http://tools.ietf.org/html/draft-daboo-et-al-icalendar-in-xml-09

Database Synchronization Interoperability Specification

	event schedules		also see: RFC5545 urn:ietf:params:xml:ns:icalendar-2.0
vCard	indication of personal contact info	vcard	http://tools.ietf.org/html/draft-ietf-vcarddav-vcardxml-10
			urn:ietf:params:xml:ns:vcard-4.0
GML	Polygon data types	gml	http://www.opengis.net/gml
XSD	standard XML Schema types	xsd	http://www.w3.org/2001/XMLSchema
			http://www.w3.org/2000/09/xmldsig#
XML-DSig	signing of records by original registrar	sig	

Thus, the <RegistrationRecordEnsemble> would typically include these namespace declarations:

```

<RegistrationRecordEnsemble
    xmlns="http://www.whitespace-db-providers.org/2011//InterDB/xsd"
    xmlns:xsd=" http://www.w3.org/2001/XMLSchema"
    xmlns:ical="urn:ietf:params:xml:ns:icalendar-2.0"
    xmlns:vcard="urn:ietf:params:xml:ns:vcard-4.0"
    xmlns:gml="http://www.opengis.net/gml"
    xmlns:sig="http://www.w3.org/2000/09/xmldsig#">

```

5.1 RegistrationRecordEnsemble

The root element of the file and the base element of the real time response is a RegistrationRecordEnsemble. The ensemble contains any number of Registration objects.

The RegistrationRecordEnsemble is signed by the EnsembleSignature, described in Section 4.13.

Each file or response is a series of Registration Records, one per registered object. Each Registered Record would contain the Type of the object, the Date on which the object was registered, and registration information which would vary according to the object Type: MVPD, TV Receive Site, LP-Aux, Temporary BAS Links and Fixed TVBD. The RegistrationRecordEnsemble will contain a NextTransactionID to be used in the Realtime Web Services method to convey to the Web Services client the value it should use for RequestedTransactionID in the next RealTimePollRequest that it sends.

Database Synchronization Interoperability Specification

Since the content of the file or response must be well-formed XML, an overall root node message is defined to contain all of the Registration elements. The RegistrationRecordEnsemble contains an inline attribute version=n.n to indicate the version of the Inter-WSDB Messaging Specification which the contents conform to, for example

```
<RegistrationRecordEnsemble version="1.0">
```

Message Definition: RegistrationRecordEnsemble (wsd:RegistrationRecordEnsemble)

```
<RegistrationRecordEnsemble
version="xsd:string [1]">
  <EnsembleDescription> EnsembleDescription </EnsembleDescription> [1] ?
  <Registration> Registration </Registration> [1...*]
  <ensembleSignature> ds:SignatureType </ensembleSignature> [1]
  <NextTransactionID> xsd:string </NextTransactionID> [0..1] ?
</RegistrationRecordEnsemble>
```

The EnsembleSignature signs the entire RegistrationRecordEnsemble. This is equivalent to signing each individual Registration record.

High-level logic:

1. Upon receiving an interDB file or poll response, check that its [per file/response] signature is valid. If so, process the records.
2. Make sure the filename of the validated file is unique (if necessary, add a timestamp to the filename) for file transfer.
3. Associate with each inserted record the [now unique] filename (for file transfer) or TransactionId (for real time).

Database Synchronization Interoperability Specification

4. Archive the validated file/response for later use in non-repudiation, should it be needed.
5. If a record is contested:
 - a. Find the record in question; look up its source filename/response
 - b. Retrieve that source file/response; demonstrate that it has a valid signature
 - c. Show that the record in question was derived from that file/response

The signing function is by means of the “Enclosed” strategy of XMLDSig such that the SignedInfo points to the RegistrationRecordEnsemble Object using Xpath. The SignatureValue calculated by the sending WSDB is also present in the EnsembleSignature element for comparison. More details are given in Section 4.13 and the Solved Examples in Appendix A.

See Section 4 for a description of the TransactionId.

5.2 Registration Record

Each protected entity is represented by one or more Registration Records:

Message Definition: Registration (wsd:Registration)

```

<Registration>
  <registrationType> xsd:string </registrationType> [1] ?
  Start Choice [1] ?
  <Fixed_TVBD_Registration> Fixed_TVBD_Registration </Fixed_TVBD_Registration> [1]
  <LP-Aux_Registration> LP-Aux_Registration </LP-Aux_Registration> [1]
  <MVPD_Registration> MVPD_Registration </MVPD_Registration> [1]
  <TV_Receive_Site_Registration> TV_Receive_Site_Registration </TV_Receive_Site_Registration> [1]
  <Temp_BAS_Registration> Temp_BAS_Registration </Temp_BAS_Registration> [1]
  End Choice
</Registration>
  
```

5.3 Registration Information and Registration Disposition

Each Registration Object contains elements that are defined by the FCC rules appropriate for that facility (MVPD, LP-Aux, TV Receive Site, Fixed TVBD and Temp_BAS_Registration). It also contains a Registration Disposition object that contains metadata about the object, especially the Action element.

This snippet shows a Registration Disposition element. More examples are given in Appendix A.

```

<RegistrationDisposition>
  <RegistrationDate>2011-03-17 17:26:03Z</RegistrationDate>
  <Action>1</Action>
  <RegistrationStatusCode>1</RegistrationStatusCode>
  <RegistrationDescription>No match of transmitter call sign/channel/location to CDBS</RegistrationDescription>
</RegistrationDisposition>
  
```

Note that the first Registration Object element (MVPD_Registration) is defined to be “flattened” such that each transmitter and receiver pair location is registered as a separate object. See

Database Synchronization Interoperability Specification

Appendix A for an example of three MVPD Registration Objects, of which one is denied, resulting from a single registration session.

Note: for all of the following registration objects where the TV transmitter is a required element the agreement is to edit the registered values against the FCC data and to provide where possible valid data. If the receiving WSDB Administrator determines that the values provided do not match the FCC data they have the option to substitute their derived values for calculation of the protected area and will inform the sending WSDB Administrator of the discrepancy.

5.4 Registration Objects

5.4.1 MVPD_Registration

Message Definition: MVPD_Registration (wsd:MVPD_Registration)

```

<MVPD_Registration>
  <RegistrationDisposition> RegistrationDisposition </RegistrationDisposition> [1] ? 
  <mvpdRegistrant> vcard:VcardType </mvpdRegistrant> [1] ? 
  <mvpdContact> vcard:VcardType </mvpdContact> [0..1] ? 
  <mvpdLocation> Location </mvpdLocation> [1] ? 
  <mvpdChannel> US_TV_Spectrum </mvpdChannel> [1] ? 
  <mvpdXmterLocation> Location </mvpdXmterLocation> [1] ? 
</MVPD_Registration>

```

5.4.2 TV_Receive_Site_Registration

Message Definition: TV_Receive_Site_Registration (wsd:TV_Receive_Site_Registration)

Database Synchronization Interoperability Specification

Database Synchronization Interoperability Specification

5.4.3 LP-Aux_Registration

Message Definition: LP-Aux_Registration (wsd:LP-Aux_Registration)

Database Synchronization Interoperability Specification

```
<LP-Aux_Registration>
  <RegistrationDisposition> RegistrationDisposition </RegistrationDisposition> [1] ?
  <lpauxRegistrant> vcard:VcardType </lpauxRegistrant> [1] ?
  <lpauxContact> vcard:VcardType </lpauxContact> [0..1] ?
  <lpauxXmterLocation> Location </lpauxXmterLocation> [1] ?
  <lpauxVenueName> xsd:string </lpauxVenueName> [0..1] ?
  <lpauxOperationalArea> [1..*] ?

    Start Choice [1]
      <lpauxPointArea> ... </lpauxPointArea> [1] ?
      <lpauxCircleArea> ... </lpauxCircleArea> [1] ?
      <lpauxQuadrilateralArea> ... </lpauxQuadrilateralArea> [1] ?
    End Choice
  </lpauxOperationalArea>
  <lpauxCallSign> xsd:string </lpauxCallSign> [0..1] ?
  <lpauxEvent> Event </lpauxEvent> [1] ?
</LP-Aux_Registration>
```

lpauxOperationalArea contains a set of point, circle or quadrilateral simple polygons. If a polygon, there must be exactly 4 vertices forming a quadrilateral, in order, clockwise, with no intersecting sides (simple polygon). No more than 25 points/circles/polylines are permitted for a single registration. See Channel Calculations for White Spaces Guidelines for the specifics regarding dimensions.

5.4.4 Fixed TVDB_Registration

Message Definition: Fixed_TVBD_Registration (wsd:Fixed_TVBD_Registration)

```

<Fixed_TVBD_Registration>
  <RegistrationDisposition> RegistrationDisposition </RegistrationDisposition> [1] ?
  <tvbdRegistrant> vcard:VcardType </tvbdRegistrant> [1] ?
  <tvbdContact> vcard:VcardType </tvbdContact> [0..1] ?
  <tvbdRegLocation> Location </tvbdRegLocation> [1] ?
  <tvbdRegDeviceId> DeviceId </tvbdRegDeviceId> [1] ?
</Fixed_TVBD_Registration>

```

5.4.5 Temp_BAS_Registration

Message Definition: Temp_BAS_Registration (wsd:Temp_BAS_Registration)

```

<Temp_BAS_Registration
version="xsd:string [1]">
  <RegistrationDisposition> RegistrationDisposition </RegistrationDisposition> [1] ?
  <tbasRegistrant> vcard:VcardType </tbasRegistrant> [1] ?
  <tbasContact> vcard:VcardType </tbasContact> [0..1] ?
  <tbasRecvLocation> Location </tbasRecvLocation> [1] ?
  <tbasChannel> US_TV_Spectrum </tbasChannel> [1] ?
  <tbasXmitLocation> Location </tbasXmitLocation> [1] ?
  <tbasEvent> Event </tbasEvent> [1] ?
</Temp_BAS_Registration>

```

There is one channel per Temp_BAS_Registration record, and tbasChannel includes the Call Sign by means of the US_TV_Spectrum data type.

5.5 EnsembleDescription

Message Definition: EnsembleDescription (wsd:EnsembleDescription)

Database Synchronization Interoperability Specification

```
<EnsembleDescription>
  <Registrar> xsd:string </Registrar> [1] ?
  <GenerationDate> xsd:dateTime </GenerationDate> [1] ?
  <Scope> Scope </Scope> [1] ?
  <RecordsFrom> xsd:dateTime </RecordsFrom> [1] ?
  <RecordsTo> xsd:dateTime </RecordsTo> [1] ?
</EnsembleDescription>
```

5.6 RegistrationDisposition

Message Definition: RegistrationDisposition (wsd:RegistrationDisposition)

```
<RegistrationDisposition>
  <RegistrationDate> xsd:dateTime </RegistrationDate> [1] ?
  <RegID> xsd:string </RegID> [1] ?
  <Action> xsd:int </Action> [1] ?
</RegistrationDisposition>
```

Note: The regID has three parts: date per ISO 8601 YYMMDD, four character WSDB Administrator name (same as used in the filename Sec 4.1.2.1) and a seven digit sequence number 0000001-9999999 which starts at 0000001 each day and is incremented by 1 for each record regardless of type.

A modify (which must use the same RegId as the original registration) can contain any set of elements, which replace former values. If a modify record does not include optional elements defined in prior insert or modify records, the values of such elements will be treated as if they were set to null values. Some records (LPAux and Temporary BAS Links) have events that specify times and dates where protection is provided. When a record has no active events, the record is still in the database, but no protection is provided. The record remains in the database until either a Modify transaction is completed to add an event, or the record is deleted. Records with no active events that persist for more than 180 calendar days can be considered deleted. Modifications are not supported beyond 180 days after expiration.

5.7 Location

Message Definition: Location (wsd:Location)

5.8 US_TV_Spectrum

Message Definition: US_TV_Spectrum (wsd:US_TV_Spectrum)

5.9 Event

Message Definition: Event (wsd:Event)

```

<Event>
  <eventTimes> ical:VcalendarType </eventTimes> [1] ??
  <eventChannel> eventChannel </eventChannel> [1...*] ??
</Event>
  
```

Note: the iCal element shall be conformant to:

<http://tools.ietf.org/html/draft-daboo-et-al-icalendar-in-xml-09>

with field definitions from RFC5545

The schema that defines this version is:

<https://www.bedework.org/svn/bwxml/trunk/schemas/icalendar/iCalendar.xsd>
which is incorporated in the schema for this document.

The VCALENDAR event is limited to a single VEVENT that can have a single RRULE and no EXRULEs.

FREQ is limited to HOUR, DAY and WEEK. BYMINUTE, BYHOUR and BYDAY are the only BYxxx qualifiers permitted

INTERVAL, COUNT or UNTIL is allowed

The iCalendar element type definition refers to a schema within a draft RFC. We anticipate that the final RFC will be identical in the definitions we use here, and when it is finalized we will adjust the reference. If the final version differs from the draft in a way that is significant to this specification, then this document will be modified. This document requires this specific version of the iCalendar specification. Any subsequent updates of the iCalendar specification will require this document to be updated to incorporate it.

5.10 DeviceId

Message Definition: DeviceId (wsd:DeviceId)

```

<DeviceId>
  <didSeriesName> DevIdSeries </didSeriesName> [1] ?
  <didSeriesValue> xsd:string </didSeriesValue> [1]
  <didSerialNumber> xsd:string </didSerialNumber> [1]
</DeviceId>
  
```

5.11 Radiation Center

Message Definition: RadiationCenter (wsd:RadiationCenter)

```
<RadiationCenter>
  <rcAMSL> xsd:int </rcAMSL> [0..1] ?
  <rcHAAT> xsd:int </rcHAAT> [0..1] ?
  <rcHAG> xsd:int </rcHAG> [0..1] ?
</RadiationCenter>
```

5.12 vCard

Contact information is included using an XML representation of a vCard

The vCard shall be conformant to:

<http://tools.ietf.org/html/draft-ietf-vcarddav-vcardxml>

representation with

<http://tools.ietf.org/html/draft-ietf-vcarddav-vcardrev-19>

field definitions.

The schema for the vCard is:

<https://www.bedework.org/svn/bwxml/trunk/schemas/vcard/vcard.xsd>

which is incorporated in the schema for this document.

Only Text and integer types are permitted

Of the Property Parameters listed in Section 5 of <http://tools.ietf.org/html/draft-ietf-vcarddav-vcardrev-19> only VALUE is permitted

Only the following properties are permitted

KIND

FN

N

ADR

TEL

EMAIL

TZ

TITLE

ORG

The vCard element type definition refers to a schema within a draft RFC. We anticipate that the final RFC will be identical in the definitions we use here, and when it is finalized we will adjust the reference. If the final version differs from the draft in a way which is significant to this specification, then this document will be modified. This document requires this specific version of the vCard specification. Any subsequent updates of the vCard specification will require this document to be updated to incorporate it.

An example of the use of the VcardType is shown below, taken from LP-Aux_Registration. The properties array is expanded and only the first two of many elements within it are shown.

5.13 EnsembleSignature Element

Signing of the `RegistrationRecordEnsemble` is by means of XMLDSIG, using the “Enclosed” method whereby the signed information is not contained within the `signature` element (which would be the “Enclosing” method) but rather the `signature` element and the signed information are sister elements, and Xpath is used to indicate the information being signed.

The elements within the `ensembleSignature` are shown below.

The `EnsembleSignature` element occurs immediately after the `RegistrationRecordEnsemble` (in this case `LP-Aux_Registration` element). The `SignedInfo` indicates both the algorithm used for signing and the path to the information, using Xpath notation. The `<XPath>` element uses unix-like Xpath notation. In addition it gives the Signature Value as calculated by the sending WSDB so that the receiving WSDB can calculate a value and do a comparison.

Canonicalization shall be Canonical XML Version 1.0.

The cryptosuite shall be SHA256-RSA. The RSA key length shall be 2048 bits.

The key shall be passed “byName” using the distinguished name of the X.509 cert of the signer. Public certs shall be distributed among providers by secure email, and must be signed by a CA recognized by popular web browsers.

The Registration files/webservice poll responses would thus be a string of Registration Records, each containing one Registered Object, which may be any of the five types defined at this point.

- 1) <MVPD_Registration>
- 2) <TV_Registration>
- 3) <LP-Aux_Registration>
- 4) <Fixed_TVBD_Registration>
- 5) <Temp_BAS_Registration

5.14 IpauxOperationalArea

The IpauxOperationalArea element is used to convey the geometry of the LP-Aux using one of three methods: Point, Circle, or Quadrilateral. The Quadrilateral is a simple polygon (no intersecting sides) with sides not necessarily parallel to latitude and longitude lines. Points are numbered clockwise from the most Northerly point, or if two points are on a latitude line, then the most Northeasterly point.

Database Synchronization Interoperability Specification

```

<lpauxOperationalArea> [1..*] ?
  Start Choice [1]
    <lpauxPointArea> PointAreaNew </lpauxPointArea> [1] ?
    <lpauxCircleArea> CircleAreaNew </lpauxCircleArea> [1] ?
    <lpauxQuadrilateralArea> QuadrilateralAreaNew </lpauxQuadrilateralArea> [1] ?
  End Choice
</lpauxOperationalArea>

```

The lpauxOperationalArea polygons use the `<gml:pos>` element to specify locations. The alternative element `<gml:coord>` is deprecated and is explicitly NOT supported in this specification.

The lpauxOperationalArea does not use the native `gml:CircleType` and `gml:PolygonType` since the `gml:CircleType` does not allow specification of a circle via centerpoint and radius. Therefore new elements are defined locally which require point + radius input for the LP-Aux circle. All three of the LP-Aux Operational Area polygons require at least one point input, and these points are of the `gml:PointType`, which contains the `gml:pos` element. The receiving application should only process the first point in any `gml:pos` element, though the XSD allows `gml:pos` to be a sequence of multiple points.

The LP-Aux XML example document in Section 9.1 illustrates this for all three geometric element types. See Channel Calculations for White Spaces Guidelines for the specifics regarding dimensions of the elements.

5.15 RealTimePollRequest

```

<RealTimePollRequest>
  <RequestedTransactionID> xsd:string </RequestedTransactionID> [1] ?
  <Command> ... </Command> [1] ?
</RealTimePollRequest>
  
```

5.16 RealTimePollResponse

```

<RealTimePollResponse>
  <RequestedTransactionID> xsd:string </RequestedTransactionID> [1] ?
  <Command> ... </Command> [1] ?
  <RegistrationRecordEnsemble> ... </RegistrationRecordEnsemble> [1] ?
  <RT-PollStatusCode> ... </RT-PollStatusCode> [1] ?
</RealTimePollResponse>
  
```

5.17 PointAreaNew

```

<PointAreaNew>
  <CenterPoint> gml:PointType </CenterPoint> [1] ?
</PointAreaNew>
  
```

5.18 CircleAreaNew

Circle size limits are in the Channel Calculation Guidelines document. The units of the **lpauxRadius** is meters.

5.19 QuadrilateralAreaNew

```
<QuadrilateralAreaNew>
  <NE_Point> gml:PointType </NE_Point> [1] ?
  <SE_Point> gml:PointType </SE_Point> [1] ?
  <SW_Point> gml:PointType </SW_Point> [1] ?
  <NW_Point> gml:PointType </NW_Point> [1] ?
</QuadrilateralAreaNew>
```

Quadrilateral edge length limits are in the Channel Calculation Guidelines document.

6 Data Mapping Considerations

The Registered Objects themselves have structure and complexity that must be considered. For example, there is a possible (likely) many-to-one relationship between an MVPD receive site and the transmitting station(s). This can be encoded directly in the registration information by means of internal aggregates. Another approach is to normalize or “flatten” the structure by considering each component of the internal aggregates separately and embedding them one at a time into Registration Records.

This version of the specification chooses the latter for simplicity, so that for MVPD we provide a discrete instance for each Receive Site – Transmitter Call Sign pair, as shown in the dashed box in the figure below which depicts a single MVPD site.

The “flattening” of an MVPD object is demonstrated by a series of Registration Records which are shown as being associated by a dashed box surrounding them. These all refer to a single MVPD location.

The Registration Record containing the LP-Aux Registration Object is a single Event and is shown elongated so that it can be shown containing multiple Start/Stop times. Each Start/Stop time is derived from the iCal definition of the event by means of a VCALENDAR block which can contain multiple VEVENT blocks to represent recurring events. Each of these VCALENDAR events is associated with the same eventChannels.

6.1 Data Completeness

All registration data would be exchanged without filtering records based on the transmitting database local logic, even if it appears to be superfluous. For example, the MVPD registration instance will be shared even if the resulting calculated contour is inscribed within or wholly contained by the contours of the TV stations transmitting to that MVPD. This is necessary to prevent unanticipated consequences of changes. For example, the parameters of the transmitting TV stations may change so that the MVPD contours are no longer wholly contained, and thus will be revealed and require protection.

7 General Whitespace Administrator Responsibilities and Error Management

7.1 Set-up and process

7.1.1 Servers and clients

WSDB Administrators shall create accounts on their systems for all other FCC-approved Administrators. Each WSDB Administrator shall be entitled to have at least 3 redundant clients accessing each server. Each WSDB administrator shall provide 1-3 redundant copies of its web service. Each WSDB Administrator must exchange the URLs of its clients and servers with each other WSDB Administrator. Changes in these URLs must be communicated no earlier than 14 days before they change. It is not necessary for a client to make use of a redundant server, if offered, but it may choose to do so.

7.1.2 HTTPS

Each client and each server shall have an X.509 certificate for use in establishing HTTPS connections. Certificates shall be emailed to other WSDB Administrators in a PKCS#7 (.p7b) file format. Certificates shall have a two-year expiration. WSDB Administrators are required to notify all parties 14 business days prior to deploying the new certificate.

7.2 Client Test Environment

Each WSDB Administrator is required to make a Client Test Environment (CTE) available to other WSDB administrators for testing purposes. The CTE shall be a functional equivalent of a production server, but it:

- a) Is not redundant, and is subject to some instability
- b) May not have the same data as the production server
- c) May have a software version higher than the production server.

The CTE may have different HTTPS certificates and will have a different URL.

WSDB Administrators must make new versions of its server code available on their CTE no earlier than 30 days before deployment on its production servers with the following exceptions:

- a) Changes that can reasonably be expected to be invisible to clients
- b) Emergency changes necessary to meet FCC obligations, serious system stability, or responding to deliberate attack.

New code versions available on the CTE must be announced 14 days in advance to all other WSDB Administrators, although slippage in schedules is recognized as a normal hazard of software development.

7.3 Error management

Clients shall retry failed file transfer or web poll operations at least 3 times, then try available alternate servers, if available, a minimum of three attempts.

If one server fails, but secondary servers work, and the failure persists for a period of a day (in the case of file transfer failures) or 5 minutes (in the case of real time failures), but alternate servers succeed, a courtesy low priority method designated by the server Adminstrator should be sent: email is suggested.

If all servers fail, the client shall notify the server Administrator by its designated high priority failure method: telephone calls are suggested, email is acceptable. All Adminstrators will share their helpdesk contact information (i.e. for example telephone number and email address) to all other Administrators to facilitate timely handling of errors and related inquires.

System maintenance/downtime is communicated to all WSDB Administrators and handled during non-critical business hours, if possible. Emergency outages are communicated immediately if downtime is longer 24 hours. It is suggested that servers have staggered maintenance so that service may be provided continuously, albeit at lower reliability, but this is NOT REQUIRED.

8 Parking Lot for V1.0

The following items are still under discussion within the group:

1. ensembleSignature implementations must be tested to ensure interoperable implementations can be realized
2. Resolve possible type collisions in imported XSDs, may impact JBOSS JEE implementation

9 Appendix A - Example Records

The root node of the XML document is the RegistrationRecordEnsemble element, which contains a number of Registration elements. Each of the five examples below is standalone and contains a RegistrationrecordEnsemble, and exactly one Registration record. This was done so that each Registration type can be validated independently against the Schema. The examples below all validate against the Schema given in Appendix B, which is the 8/25/11 Checkpoint.

9.1 LP-Aux Example
